#### Abstract

The aim of this article is to review the position of certain countries of the European Union (EU) and Serbia with regard to the development of research and development activities in the function of strengthening in the future by applying relevant measures. The research of the treated problem in this paper is based on the application of the modern multi-criteria decision-making method known as the LMAW-DNMA method. Research on the performance indicators of research and development of the countries of the European Union and Serbia using the LMAW-DNMA method showed that the top five countries of the European Union in terms of research and development are in order: Germany, France, Italy, the Netherlands and Poland. Serbia is positioned in twenty-third place (Croatia twenty-seventh place, Slovenia twenty-fourth place). Therefore, the leading countries of the European Union are at the top in terms of research and development.

Keywords: LMAW-DNMA method; Investment in R\&D; European Union countries; Serbia.

## 1. INTRODUCTION

The issue of research and development (R\&D) and selection of research and development projects is very challenging, important, current and complex. The impact of research and development on innovation, development of new technology, competitiveness, growth, efficiency and performance of all entities (economy, region, company) is very significant (Ayan \& Abacıoğlu, 2022; Николаева, 2022). For these reasons, the issue of research and development is comprehensively researched and studied. Based on that, this paper comparatively analyzes the research and development performance indicators of the European Union (EU) and Serbia. In doing so, a modern multi-criteria decision-making method known as the LMAW-DNMA method is applied. The goal and purpose of the research of the treated problem in this paper is to see it as fully as possible in the function of improving the research and development activities of the

European Union and Serbia by applying relevant measures. The effects of this are to improve the performance of all entities.

## 2. LITERATURE REVIEW

There is an increasingly rich literature devoted to the analysis of research and development issues. It is considered from different aspects (Lukic \& Vojteski Kljenak, 2017; Lukic \& Perovic, 2019; Lukic, 2022, 2023a,b,c). We will point out some of them. In a separate study, the impact of research and development on entrepreneurship, innovation, digitization and digital transformation is discussed (Ancillo \& Gavrila, 2023). Considerable attention has been paid to the relationship between R\&D expenditure and economic growth in the BRICS-T countries (Bayraktar et al., 2022). A very important issue in the literature is the macroeconomic effects of public research and development (De Lipsis et al., 2023). Likewise, a comparative study on the efficiency of
research and development activities of universities in China by region using the DEAMalmquist approach (Du \& Seo, 2022). A special aspect of research in the literature is the application of the fuzzy MCDM method in the evaluation of R\&D projects (Dursun \& Lılıç, 2023; Şen, 2023) and territorial effects (Fernández-García Tania et al., 2022). The impact of R\&D activities on productivity is significant (Foreman-Peck \& Zhou, 2022). Likewise, product and process innovations in Latin American countries (Henriquez et al., 2023). In the literature, special attention is paid to the analysis of the public fund for research and development intended for investment in the technology of renewable energy sources in Europe (Gasser et al., 2022). In a separate study, the issue of assessing the effectiveness of investments in research and development in the countries of the European Union was analyzed (Ginevičius, 2023). Investments in research and development are a significant determinant of business performance (He \& Estébanez, 2023) and innovative activities (Janjić et al., 2021; Kučera \& Milan Fil’a, 2022; Roszko-Wójtowicz et al., 2022). The question of the role of investments in research and development in sustainable development has been investigated in the literature (Rybalkin, 2022; Wu, 2023). Investments in research and development significantly affect innovation and thus the value of the company (Wanicki \& Bartłomiej Nita, 2022).

## 3. RESEARCH METHODOLOGY

Performance indicators of research and development can be analyzed in a classic way and by applying multi-criteria decision-making methods. Application of multi-criteria decision-making methods gives more accurate results compared to classical analysis. Because several criteria are taken into account at the same time. Bearing that in mind, in this paper, the performance analysis of research and development indicators is performed using the LMAW-DNMA method.

The LMAW (Logarithm Methodology of Additive Weights ) method is the latest method used to calculate criteria weights and rank alternatives (Demir, 2022; Liao \& Wu, 2020). It takes place through the following steps : $m$ alternatives $A=\left\{A_{1}, A_{2}, \ldots, A_{m}\right\}$ are evaluated
in comparison with $n$ criteria $C=$ $\left\{C_{1}, C_{2}, \ldots, C_{n}\right\}$ with the participation of $k$ experts $E=\left\{E_{1}, E_{2}, \ldots, E_{k}\right\}$ and according to a predefined linguistic scale (Pamučar et al, 2021).

Step 1: Determination of weight coefficients of criteria

Experts $E=\left\{E_{1}, E_{2}, \ldots, E_{k}\right\}$ set priorities with criteria $C=\left\{C_{1}, C_{2}, \ldots, C_{n}\right\}$ in relation to previously defined values of the linguistic scale. At the same time, they assign a higher value to the criterion of greater importance and a lower value to the criterion of less importance on the linguistic scale. By the way, the priority vector is obtained. The label $\gamma_{c n}^{e}$ represents the value of the linguistic scale that the expert $e(1 \leq e \leq k)$ assigns to the criterion $C_{t}(1 \leq$ $t \leq n)$.

Step 1.1: Defining the absolute anti-ideal point $_{\text {AIP }}$

The absolute ideal point should be less than the smallest value in the priority vector. It is calculated according to the equation:

$$
\gamma_{A I P}=\frac{\gamma_{\min }^{e}}{S}
$$

where is $\gamma_{\text {min }}^{e}$ the minimum value of the priority vector and $S$ should be greater than the base logarithmic function. In the case of using the function Ln , the value of $S$ can be chosen as 3 .

Step 1.2: Determining the relationship between the priority vector and the absolute anti-ideal point

The relationship between the priority vector and the absolute anti-ideal point is calculated using the following equation:

$$
\begin{equation*}
n_{C n}^{e}=\frac{\gamma_{C n}^{e}}{\gamma_{A I P}} \tag{1}
\end{equation*}
$$

So the relational vector $R^{e}=$ $\left(n_{C 1}^{e}, n_{C 2}^{e}, \ldots, n_{C n}^{e}\right)$ is obtained. Where it $n_{C n}^{e}$ represents the value of the real vector derived from the previous equation, and $R^{e}$ represents the relational vector $e(1 \leq \mathrm{e} \leq \mathrm{k})$.

Step 1.3: Determination of the vector of weight coefficients

The vector of weight coefficients $w=$ $\left(w_{1}, w_{2}, \ldots, w_{n}\right)^{T}$ is calculated by the expert $e(1 \leq e \leq k)$ using the following equation:

$$
\begin{equation*}
w_{j}^{e}=\frac{\log _{A}\left(n_{C n}^{e}\right)}{\log _{A}\left(\prod_{J=1}^{n} n_{C n}^{e}\right)}, A>1 \tag{2}
\end{equation*}
$$

where $w_{j}^{e}$ it represents the weighting coefficients obtained according to expert evaluations $e^{t h}$ and the $n_{C n}^{e}$ elements of the realization vector $R$. The obtained values for the weighting coefficients must meet the condition that $\sum_{j=1}^{n} w_{j}^{e}=1$.

By applying the Bonferroni aggregator shown in the following equation, the aggregated vector of weight coefficients is determined $w=\left(w_{1}, w_{2}, \ldots, w_{n}\right)^{T}$

$$
\begin{equation*}
W_{j}=\left(\frac{1}{k .(k-1)} \cdot \sum_{x=1}^{k}\left(w_{j}^{(x)}\right)^{p} \cdot \sum_{\substack{y=1 \\ y \neq x}}^{k}\left(w_{i j}^{(y)}\right)^{q}\right)^{\frac{1}{p+q}} \tag{3}
\end{equation*}
$$

The value of $p$ and $q$ are stabilization parameters and $p, q \geq 0$. The resulting weight coefficients should fulfill the condition that $\sum_{j=1}^{n} w_{j}=1$.

The DNMA (Double Normalization-based Multiple Aggregation) method is a newer method for showing alternatives (Demir, 2022). Two different normalized (linear and vector) techniques are used, as well as three different coupling functions (full compensation - CCM, non-compensation UCM and incomplete compensation - ICM). The steps of applying this method are as follows (Ecer, 2020; Liao \& Wu, 2020):

Step 1: Normalized decision matrix
The elements of the decision matrix are normalized with linear $\left(\hat{x}_{i j}^{1 N}\right)$ normalization using the following equation:
$\hat{x}_{i j}^{1 N}=1-\frac{\left|x^{i j}-r_{j}\right|}{\max \left\{\max _{i} x^{i j}, r_{j}\right\}-\min \left\{\min _{i} x^{i j}, r_{j}\right\}}$
The vector $\left(\hat{x}_{i j}^{2 N}\right)$ is normalized using the
following equation:

$$
\begin{equation*}
\hat{x}_{i j}^{2 N}=1-\frac{\left|x^{i j}-r_{j}\right|}{\sqrt{\sum_{i=1}^{m}\left(x^{i j}\right)^{2}+\left(r_{j}\right)^{2}}} \tag{5}
\end{equation*}
$$

The value $r_{j}$ is the target value for $c_{j}$ the criterion and is considered $\max _{i} x^{i j}$ for both utility and $\min _{i} x^{i j}$ cost criteria.

Step 2: Determining the weight of the criteria
This step consists of three phases:
Step 2.1: In this phase, the standard deviation $\left(\sigma_{j}\right)$ for the criterion $c_{j}$ is determined with the following equation where $m$ is the number of alternatives:

$$
\begin{equation*}
\sigma_{j}=\sqrt{\frac{\sum_{i=1}^{m}\left(\frac{x^{i j}}{\max _{i} x^{i j}}-\frac{1}{m} \sum_{i=1}^{m}\left(\frac{x^{i j}}{\max _{i} x^{i j}}\right)\right)^{2}}{m}} \tag{6}
\end{equation*}
$$

Step 2.2: Values of the standard deviation calculated for the criteria se normalize with the following equation:

$$
\begin{equation*}
w_{j}^{\sigma}=\frac{\sigma_{j}}{\sum_{i=1}^{n} \sigma_{j}} \tag{7}
\end{equation*}
$$

Step 2.3: Finally, the weights are adjusted with the following equation:

$$
\begin{equation*}
\widehat{w}_{j}=\frac{\sqrt{w_{j}^{\sigma} \cdot w_{j}}}{\sum_{i=1}^{n} \sqrt{w_{j}^{\sigma} \cdot w_{j}}} \tag{8}
\end{equation*}
$$

Step 3: Calculating the aggregation model
Three aggregation functions (CCM, UCM and ICM) are calculated separately for each alternative. CCM (Complete Compensatory Model) is calculated using the following equation:

$$
\begin{equation*}
u_{1}\left(a_{i}\right)=\sum_{j=1}^{n} \frac{\widehat{w}_{j} \cdot \hat{x}_{i j}^{1 N}}{\max _{i} \hat{x}_{i j}^{1 N}} \tag{9}
\end{equation*}
$$

The UCM (Uncompensatory Model) is calculated using the following equation:

$$
\begin{equation*}
u_{2}\left(a_{i}\right)=\max _{j} \widehat{w}_{j}\left(\frac{1-\hat{x}_{i j}^{1 N}}{\max _{i} \hat{x}_{i j}^{1 N}}\right) \tag{10}
\end{equation*}
$$

The ICM (Incomplete Compensatory Model) is calculated using the following equation:

$$
\begin{equation*}
u_{3}\left(a_{i}\right)=\prod_{j=1}^{n}\left(\frac{\hat{x}_{i j}^{2 N}}{\max _{i} \hat{x}_{i j}^{2 N}}\right)^{\widehat{w}_{j}} \tag{11}
\end{equation*}
$$

Step 4: Integration of utility values
The calculated utility functions are integrated with the following equation using the Euclidean principle of distance:

$$
\begin{gather*}
D N_{i}=w_{1} \sqrt{\varphi\left(\frac{u_{1}\left(a_{i}\right)}{\max _{i} u_{1}\left(a_{i}\right)}\right)^{2}+(1-\varphi)\left(\frac{m-r_{1\left(a_{i}\right)+1}}{m}\right)^{2}}-w_{2} \sqrt{\varphi\left(\frac{u_{2}\left(a_{i}\right)}{\max _{i} u_{2}\left(a_{i}\right)}\right)^{2}+(1-\varphi)\left(\frac{r_{2}\left(a_{i}\right)}{m}\right)^{2}} \\
+w_{3} \sqrt{\varphi\left(\frac{u_{3}\left(a_{i}\right)}{\max _{i} u_{3}\left(a_{i}\right)}\right)^{2}+(1-\varphi)\left(\frac{m-r_{3}\left(a_{i}\right)+1}{m}\right)^{2}} \tag{12}
\end{gather*}
$$

In this case, the means $r_{1}\left(a_{i}\right)$ and $r_{3}\left(a_{i}\right)$ represent the ordinal number of the alternative $a_{i}$ sorted by CCM and ICM functions in descending value (higher value first). On the other hand, $r_{2}\left(a_{i}\right)$ it shows the sequence number in the obtained order according to the increasing value (smaller value first) for the UCM function used. The label $\varphi$ is the relative importance of the child value used and is in the range [0.1]. It is considered that it can be taken as $\varphi=0.5$. The coefficients $w_{1}, w_{2}, w_{3}$ are obtained weights of the used functions CCM, UCM and ICM, respectively. The sum should be equal $w_{1}+$ $w_{2}+w_{3}=1$.

When determining the weights, if the decision maker attaches importance to a wider range of performance alternatives, he can set a higher value for $w_{1}$. In case the decision maker is not willing to take risks, ie. to choose a poor alternative according to some criterion, he can assign a higher weight to $w_{2}$. However, the decision maker may assign a greater weight to $w_{3}$ if he simultaneously considers overall performance and risk. Finally, the $D N$ values are sorted in descending order, with the higher value alternatives being the best.

## 4. RESULTS AND DISCUSSION

Recently, gross domestic expenditures for research and development have been increasing due to their importance in almost all countries of the world. In 2021, they amounted to $2.27 \%$ of the gross domestic product in the European Union, China (except Hong Kong)
$2.40 \%$, Japan $3.26 \%$ and United States $3.45 \%$ (Source: Eurostat). Gross domestic expenditure on research and development is higher in the United States than in the European Union, China (except Hong Kong) and Japan. In the European Union, gross domestic expenditure on research and development is lower than in China (except Hong Kong), Japan and the United States.

In all countries of the world, the participation of women in the total number of researchers is increasing. The participation of women in the total number of researchers in the leading countries of the European Union in 2019 was: Germany $28.1 \%$, France $28.3 \%$ and Italy $34.2 \%$. In the same year, it was $48.3 \%$ in Croatia and $33.3 \%$ in Slovenia. In Serbia, the participation of women in the total number of researchers in 2019 was 51.9\% (Source: Eurostat). It is therefore higher than in the countries in the region (Croatia and Slovenia).

Table 1 shows the criteria, alternatives and initial data for 2021 (Annex).

Table 2 shows the correlation matrix of the initial data (annex).

There is therefore a strong correlation between Gross domestic expenditure on R\&D, ( $€ \mathrm{Mio}$ ), Government budget allocations for R\&D, (\% of GDP) and Government budget allocations for R\&D, ( $€$ per inhabitant), and Number of researchers, (thousand full-time equivalents) at the level of statistical significance.

In this work by applying the LMAW method, the weight coefficients of the criteria are calculated (Table 3 - Annex, Figure 1).

Figure 1: Weighting coefficients and ranking criteria

In this specific case, the most important criterion is C5-Gross domestic expenditure on R\&D, (\%, relative to GDP). This means, in other words, that significant financial allocations for research and development can influence the achievement of target research results.

The selection and ranking of individual countries of the European Union and Serbia according to performance indicators of research and development will be carried out using the LMAW-DNMA method (Table 4 10 annex). (All calculations and results are by the authors).

The following can be pointed out in the discussion: First, the analysis of the problem treated in this work using the LMAW-DNMA method showed that the top five countries of the European Union in terms of research and development are, in order: Germany, France, Italy, the Netherlands and Poland. Therefore, the leading countries of the European Union are at the top in terms of research and development. In the European Union, Luxembourg ranks last in terms of research and development. Other, Serbia is positioned in twenty-third place. It therefore took a slightly better position than Croatia (twenty-seventh place) and Slovenia (twenty-fourth place). And finally, in terms of research and development, Serbia is significantly behind the leading
countries of the European Union. This means, in other words, that Serbia needs to invest significantly more in research and development. The effects of this are the improvement of the overall performance of the Serbian economy. All in all, research and development are one of the critical factors of business success. In view of that, it is necessary to optimize financial allocations for research and development.

## 5. CONCLUSION

The analysis of the problem treated in this work using the LMAW-DNMA method showed that the top five countries of the European Union in terms of research and development are, in order: Germany, France, Italy, the Netherlands and Poland. Therefore, the leading countries of the European Union are at the top in terms of research and development. In the European Union, Luxembourg ranks last in terms of research and development. Serbia is positioned in twenty-third place. It therefore took a slightly better position than Croatia (twentyseventh place) and Slovenia (twenty-fourth place). In terms of research and development, Serbia is significantly behind the leading countries of the European Union. This means, in other words, that Serbia needs to invest significantly more in research and development. The effects of this are the
improvement of the overall performance of the Serbian economy.

In relation to the existing literature, the contribution of this paper is that, based on the latest available empirical data, using the latest method of multi-criteria decision-making (LMAW-DNMA), it indicates: what is the performance position of the countries of the European Union and Serbia in terms of research and development as a critical business factor success? This provides the basis for further theoretical, methodological, and empirical research on the problem of measurement and analysis of research and development performance in the countries of the European Union and Serbia and improvements in the future through the application of relevant measures. Likewise, it enables a comparative analysis of research and development performance indicators of the countries of the European Union and Serbia with other comparable countries (USA, China, Japan, Russia, etc.). Based on this, the performance of research and development can be improved as a critical factor for the business success of all countries.
